

# Co-Create Studios — Website

---

This is the website for Co-Create Studios (29 West Capitol Drive, Kapitolyo, Pasig).

It's a **single static page** — no server, no database, no install step. Everything (markup, styling, and the scroll animation) lives in one file: `index.html`. That makes it simple to host almost anywhere, and simple to break if you're not careful editing it — so read the "Editing content" section before changing anything.

---

## 1. What's in this folder

---

|                                   |                                                                 |
|-----------------------------------|-----------------------------------------------------------------|
| <code>index.html</code>           | The entire site — HTML, CSS and JavaScript in one file          |
| <code>1.png</code>                | The wing-mark logo shown top-left in the header                 |
| <code>cocreate-reel.mp4</code>    | The looping hero video (used instead of the Instagram embed)    |
| <code>testimonials/</code>        | Client testimonial video clips                                  |
| <code>testimonials/thumbs/</code> | Thumbnail images for those videos (shown before you click play) |

`index.html` is a large file (a couple of MB) because a few fallback images are embedded directly inside it as text. That's intentional — don't be alarmed when you open it and see a huge wall of text partway through; just use your editor's search (Ctrl/Cmd+F) to jump to what you need instead of scrolling.

---

## 2. Viewing it on your own computer

---

You technically *can* double-click `index.html` and it'll open in a browser, but some browsers restrict video playback for files opened this way. It's more reliable to serve the folder with a tiny local web server:

**Option A — Python (already installed on most Macs):**

```
cd "cocreate-site 2"
python3 -m http.server 8000
```

Then open `http://localhost:8000` in your browser.

**Option B — VS Code:** Install the "Live Server" extension, right-click `index.html`, choose "Open with Live Server."

**Option C — Node:**

```
npx serve .
```

Any of these let you preview exactly what visitors will see.

---

### 3. Putting it on your own domain

---

Because this is a plain static site, it will run on **any** web host — you are not locked into a particular provider. Broadly, there are two kinds of hosting, and either works fine:

#### Option A: A modern static host (easiest, usually free)

Services like **Netlify**, **Vercel**, **Cloudflare Pages**, or **GitHub Pages** let you drag-and-drop this folder and get a live URL in under a minute.

General steps (Netlify as an example — the others are nearly identical):

1. Create a free account at the host of your choice.
2. Drag this whole folder onto their "deploy" page (or connect a GitHub repo if you prefer version control).
3. You'll get a temporary URL like `yoursite.netlify.app` — confirm the site works there first.
4. In the host's dashboard, find "**Add custom domain**" and enter your domain (e.g. `cocreatestudios.ph`).
5. The host will show you one or two DNS records to add — usually either an **A record** (pointing to an IP address) or a **CNAME record** (pointing to something like `yoursite.netlify.app`).
6. Log into wherever you bought the domain (GoDaddy, Namecheap, Google Domains, etc.), open its DNS settings, and add exactly the records the host gave you.
7. Wait — DNS changes can take anywhere from a few minutes to ~48 hours to fully propagate. The host will usually show a green checkmark once it sees your domain pointing correctly, and will auto-issue a free HTTPS certificate.

#### Option B: Traditional web hosting (cPanel / shared hosting)

If you already pay for hosting (common with providers aimed at the Philippines market, e.g. Hostinger, Hostgator):

1. Log into your hosting control panel (often cPanel).
2. Open **File Manager**, navigate to `public_html` (the folder that serves your domain's root).
3. Upload every file and folder from this project into `public_html` ( `index.html` , `1.png` , `cocreate-reel.mp4` , and the `testimonials/` folder) — or upload a zip and use "Extract."
4. If your domain is already registered with that same host, it usually works immediately. If the domain lives elsewhere, point its nameservers or DNS A record to your host — your hosting provider's support page will have the exact values.
5. Visit your domain to confirm it loads.

**Either way, make sure the `testimonials/` folder (with its `thumbs/` subfolder) and `1.png` and `cocreate-reel.mp4` go up alongside `index.html` — if those are missing, the videos/logo on the live site will be broken even though the page itself still loads.**

---

## 4. Editing the content

---

Everything is inside `index.html` . Open it in a text editor and use **search (Ctrl/Cmd+F)** for these landmarks rather than scrolling — the file is long because of embedded fallback images.

| What you want to change                      | Search for this text                                                                                                                                                         |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Logo in the top-left header                  | Replace the file <code>1.png</code> with a new image of the same name. Size is controlled by the <code>.brand-mark</code> CSS rule near the top of the file.                 |
| Hero headline / subheading                   | <code>A playground</code>                                                                                                                                                    |
| Address / about blurb                        | <code>29 West Capitol Drive</code>                                                                                                                                           |
| Instagram link                               | <code>cocreatestudios.mn</code>                                                                                                                                              |
| Pricing (rates shown in the Booking section) | <code>Shoots, 6 hours</code>                                                                                                                                                 |
| Booking button link (currently Setmore)      | <code>cocreatestudiosmn.setmore.com</code>                                                                                                                                   |
| Written reviews (the star-rating quotes)     | <code>var REVIEWS</code>                                                                                                                                                     |
| Video testimonials (the carousel)            | <code>var TESTIMONIALS</code> — see below                                                                                                                                    |
| Hero looping video                           | The file <code>cocreate-ree1.mp4</code> — replace it with a new clip of the same filename, or change the <code>EXTERNAL_MP4</code> variable to point at a different filename |

## Adding / changing a video testimonial

Find `var TESTIMONIALS` in `index.html`. Each entry looks like this:

```
{ src:'testimonials/ADS 01 - SHEENA.mp4', poster:'testimonials/thumbs/sheena.jpg',
  name:'Sheena Gutierrez', role:'Coach for Designers, The Six Figure Designer Academy' },
```

- `src` — path to the video file inside the `testimonials/` folder
- `poster` — path to a thumbnail image inside `testimonials/thumbs/` (shown before the clip plays; without one it will try to use a video frame instead)
- `name` / `role` — the caption shown under the player

To add a new testimonial: drop the video file into `testimonials/`, generate a thumbnail for it (any frame grab works — even a phone screenshot of the video paused), drop that into `testimonials/thumbs/`, then add a new line to the `TESTIMONIALS` array following the pattern above. To remove one, delete its line.

---

## 5. A couple of things worth knowing

---

- **No install step, no npm, no build.** Everything the page needs (fonts, the 3D library used for the animated logo) loads from the internet automatically when someone visits — you don't need to install anything to deploy it.
- **The testimonial videos are large** (20–35MB each). That's fine for most hosts, but it does mean the testimonials section can be slow to load on weak mobile connections. If that becomes a problem, consider compressing the clips (e.g. with [HandBrake](#) or `ffmpeg` ) or hosting them on a video platform (YouTube/Vimeo unlisted, or a CDN) instead of serving the raw files yourself.
- **No WebGL fallback is automatic.** On very old browsers or devices that can't run the animated 3D logo, the site automatically switches to a simpler static layout — no action needed on your part.
